

PROJECT PROPOSAL

PERSONAL COURIER SERVICES

*A brand-new solution for
innovating cross-country logistics
with a versatile delivery app.*

*Brought to you by:
Teque (Digital Innovation Solutions)*

Introduction Overview i

In an increasingly interconnected world, the need for efficient and reliable nationwide logistics has become a fundamental requirement for organizations of all shapes and sizes. The challenges of delivering goods, products, and services from one corner of a country to another are shared by industries spanning from healthcare to retail, from manufacturing to humanitarian aid. The existing methods often fall short, resulting in delayed deliveries, inefficient tracking, and substantial costs.

Recognizing this pressing need, our proposal seeks to introduce a transformative solution that transcends industry boundaries. We present an innovative and versatile delivery service designed to meet the diverse requirements of any organization, enabling streamlined logistics operations that extend beyond the limitations of traditional methods.

Our approach encompasses a state-of-the-art application, a network of private drivers, and a commitment to overcoming the challenges associated with cross-country logistics. What sets our solution apart is its remarkable cost-effectiveness. By utilizing ordinary drivers who are already traveling along specific routes, we have significantly reduced the cost of delivery. This cost-saving approach is a game-changer for organizations seeking to optimize their logistics operations.

Whether you are a medical facility seeking timely delivery of vital supplies, an e-commerce giant striving to enhance customer satisfaction, or a charitable organization aiming to efficiently distribute aid, our solution is tailored to serve your needs at a fraction of the cost you might expect with traditional delivery services.

Join us in exploring a new era of logistics, one where efficient nationwide deliveries are no longer a challenge but a strategic advantage.

Problem statement

The pitfalls of current delivery system

Inefficiency and Cost

The existing methods of nationwide logistics are often plagued by inefficiency, leading to substantial costs for organizations. High delivery charges eat into budgets and reduce the overall profitability.

Tracking and Transparency

Many current delivery systems lack the ability to effectively track packages, leading to uncertainty and potential issues with lost or delayed deliveries. This lack of transparency can erode trust and customer satisfaction.

Remote locations

Some destinations are located away from main routes and locations. As such, packages are inconveniently delivered a distance away from their intended destination, proving a challenge for the receivers.

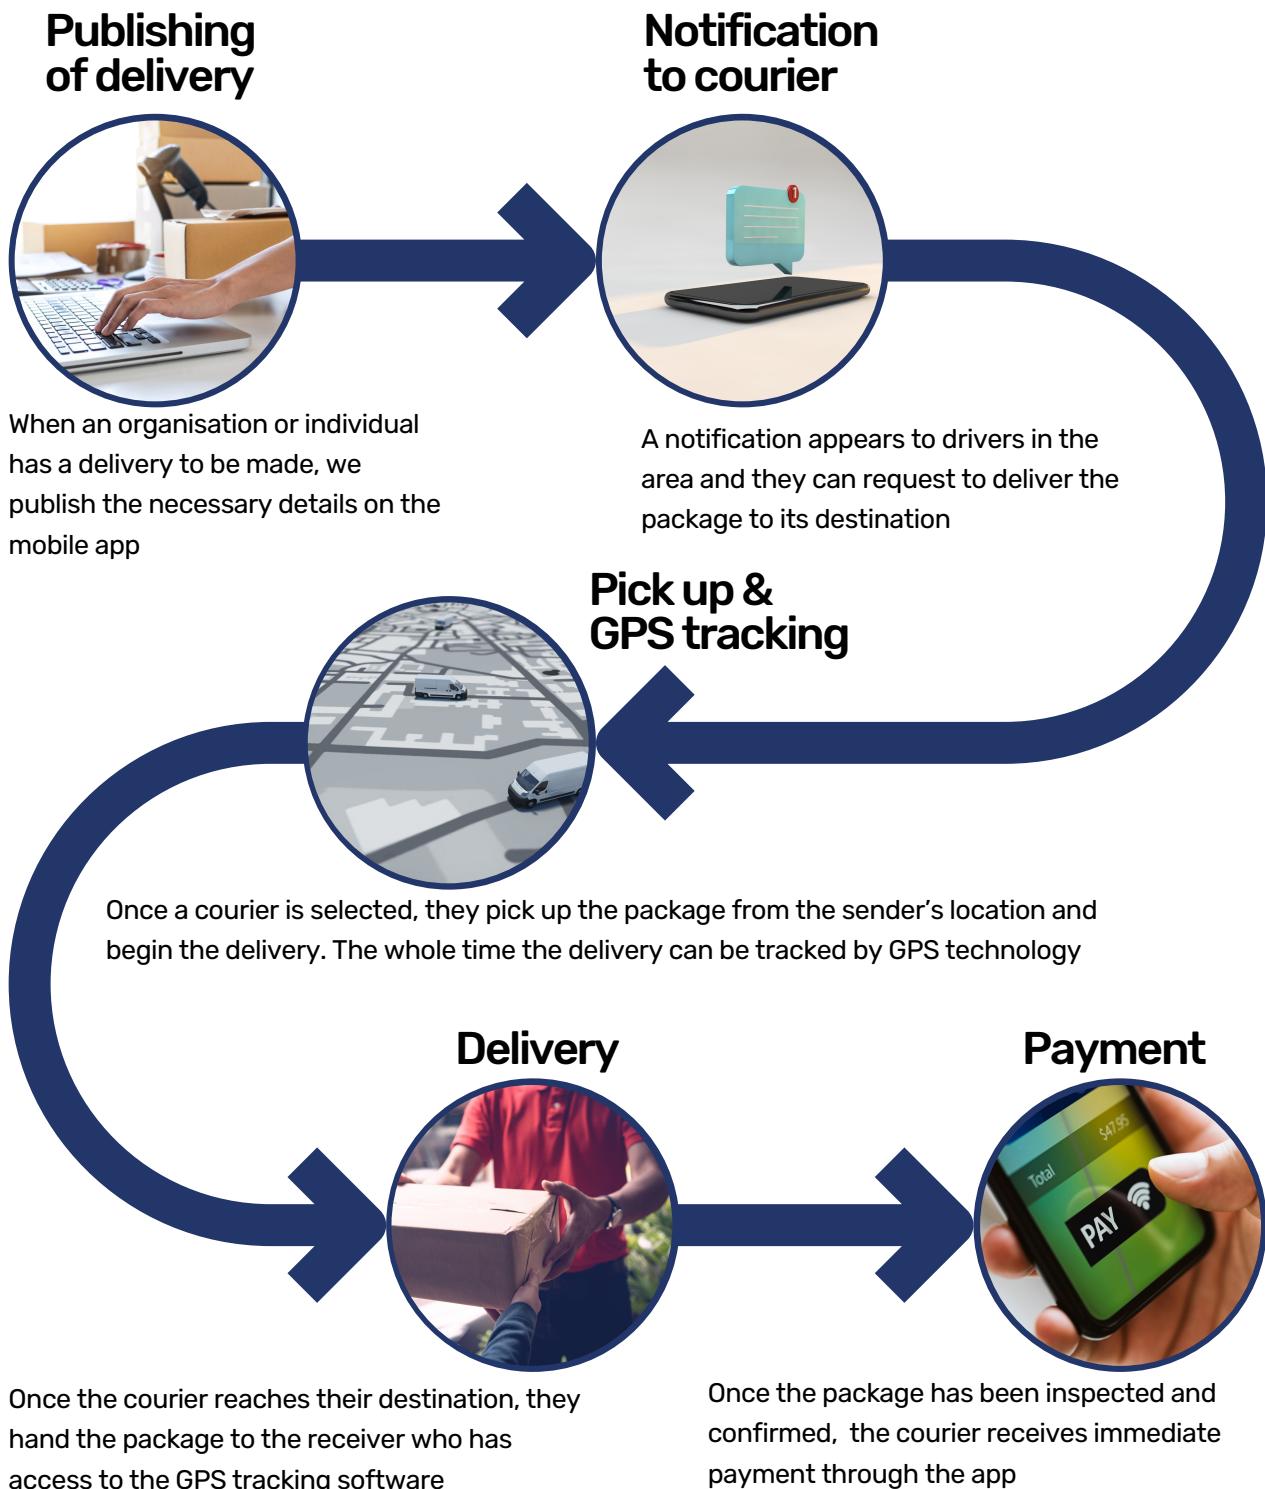

Delivery Guarantees

Meeting delivery timelines, especially in remote or poorly connected areas, is a significant challenge. The inability to guarantee timely deliveries can disrupt operations and impact customer service.

Project description

A breakdown of the proposed plan

A proposed solution to the problem of nationwide delivery inefficiency involves engaging ordinary day to day road users/passenger vehicle drivers. By using a safe and secure online platform managed by a Teque DIC.

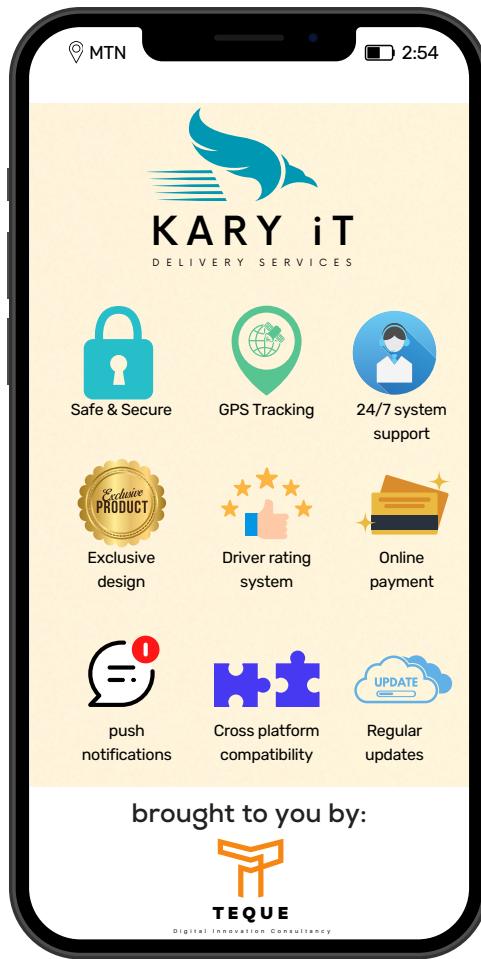

Project features

A breakdown of the proposed plan

1. Development of mobile application

The development and customization of a mobile app is essential in the implementation of the new delivery system.

A few key features needed for such a robust app include:

- **GPS Capabilities:** Utilising WAAS for live and accurate GPS tracking of the packages will allow for a streamlined and efficient system.
- **Safety & Security:** The app will be required to adhere to the strictest security standards. This would be to protect both the drivers and the packages they are transporting.
- **User Friendly:** An easy to navigate interface is very essential to support ease of use and encourage more users
- **Customer care and support:** In the case of unforeseen problems during delivery, drivers should be able to get immediate assistance through the app. This will reinforce the safety aspect of the project and speak to its reliability.

Project features

A breakdown of the proposed plan

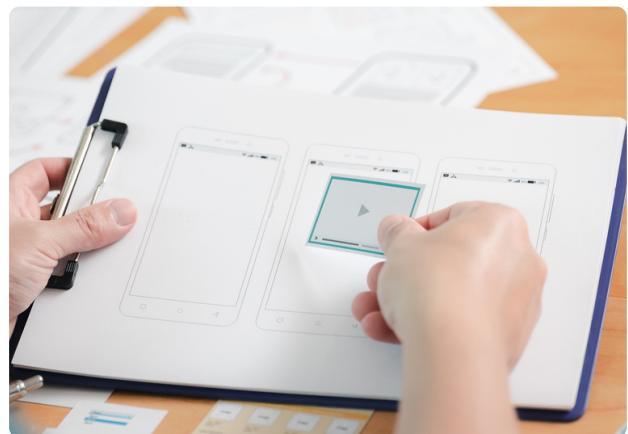

2. Recruitment of couriers

Two main specifications will need to be confirmed and standards met for drivers to be registered as couriers.

Police Clearance by Zambia Police (ZP)

Each driver that is applying to be a courier would have to undergo a thorough background check, conducted by the Zambia Police. Once cleared of criminal charges, the individual will have completed the first step in the application process

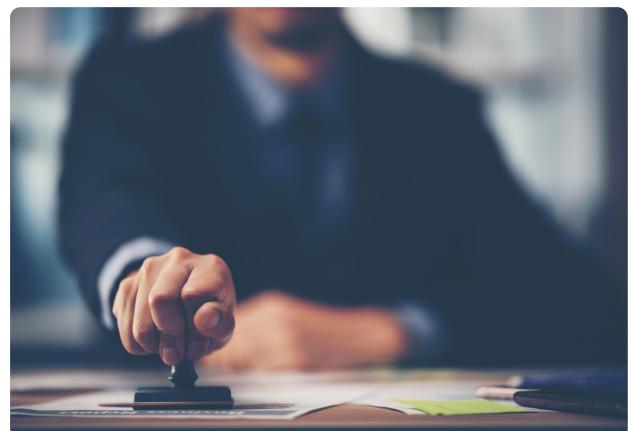

Vehicle inspection by the Road Transport & Safety Agency (RTSA)

A thorough inspection of the vehicle is carried out by RTSA, to check the validity of the Road tax, Insurance and general fitness. Extra specifications can be included at Onesight's discretion

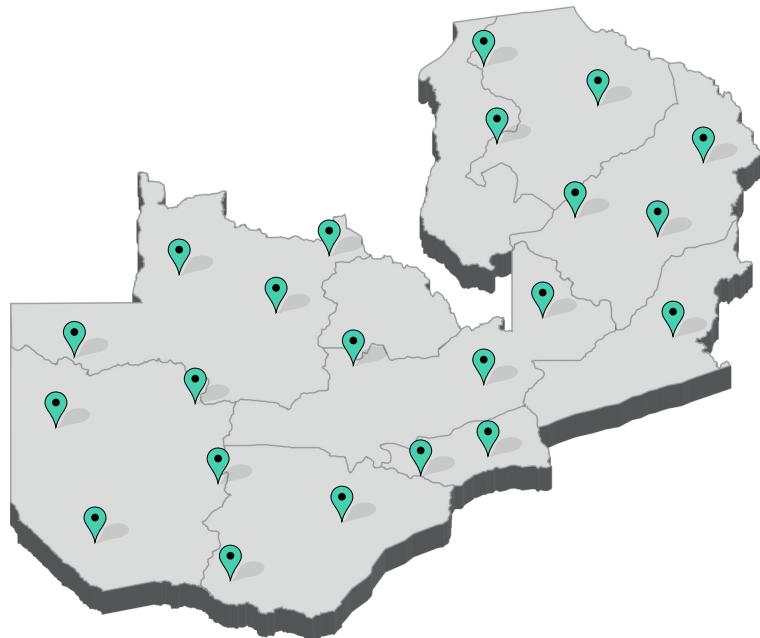

Final Approval

Teque makes the final decision over which drivers we can accept as couriers based on factors such as justification for travel through specified routes and as such, reserves the right to remove any drivers from the database for reasons that we see fit.

Project Insights

Conclusion

The Private Courier Service is a brand new idea although it is done in some form or another in the US and Europe. The major advantage being that it is fully customizable to the specifications that could be set. Further, it has the potential to be applied in different ways and by various institutions such as the Ministry of Health and private organisations in all industries as well by individuals.

Innovative and adaptable, our proposed solution aims to transform the landscape of nationwide logistics. By bridging the gap between organizations and everyday road users, we open the doors to a new era of efficient, cost-effective deliveries. This is an opportunity to optimize logistics, save resources, and drive growth. Join us in revolutionizing the way goods and services reach their destinations. Together, we can Kary it forward."

Benefits of the Private Delivery Courier service

Increased tracking ability
of packages during transit

Reduced risk of damage
to / loss of packages

Increased guarantee of
door step deliveries
